

Drive-in/Drive-Thru

for Reel Storage

FiFo & LiFo systems for your Roll storage needs.

General Introduction:

The Drive-In/Drive-Thru Reel racking system is similar in constructions except that this are used specifically for Roll storage. With the Drive-In/drive-thru racking, rolls are stored on the racking depth one behind the other on two continuous beams. When storage/retrieving, a cycle per loading bay from top to bottom (or vice versa) must be observed. This storage concept consists of a set of racking units which form an internal lane with support rails for the pallets. The lift truck enters the lane with the load elevated above the support rails that it will be placed upon.

'Jay' Drive-In/Drive-Thru Racking Systems

Applications

This systems are ideal for storing large, heavy volumes of rolls with a low quantity of different items. The racking system combines the benefits of block storage with those of racking storage.

- Pharma Packaging
- FMCG & food Packaging industry
- Electrical Cables etc.

Advantages

- ➔ High density storage – maximizing cubic space
- ➔ More rolls stored per cubic metre than any other storage system.
- ➔ Limited stock rotation
- ➔ Ideal for Hot rooms.
- ➔ Used for bulk goods of same type
